

Pravaah

Screenshot walkthrough — the four slices, live-verified

Every screenshot in this deck was taken against a real running instance of the app (**npm run dev**, driven with Playwright) — sample data loaded, real actions approved, real Groq/Open-Meteo/pdf-parse round-trips completed. Nothing here is a mockup.

/live ("Live Ops") is the primary judge-facing screen: a compact Timeline row (days to match + a T-90..Match night stepper), a real weather reading, one action card at a time, and — new this pass — a Predicted vs Actual card with a demo scan feed and live recalibration. The walkthrough below follows that screen end to end, then covers the after-event report and the venue-owner safety-document check.

SETUP

1. Give Pravaah your event

Venue owner? → Skip to Live Ops (flagship demo) →

Give Pravaah your event

Every risk, action and message from here on comes from what you enter below — not a demo script.

QUICK START — 6 NUMBERS, AN IMMEDIATE FIRST ANSWER

Step 1

Venue

Wankhede Stadium (Mumbai) — cached, works offline

Capacity (expected turnout)

30000

Expected turnout %

90

Match date

26-11-2026

Gates open

19:30

Get my first answer →

Everything not listed above (lanes, forecourt sizes, stations, hotels) starts as a labelled estimate. Add real detail below any time.

USE THE SAMPLE EVENT

Step 2a

An illustrative fixture at DY Patil Stadium — real coordinates, invented ticket/arrival numbers, every row labelled. Good for seeing what a fuller dataset unlocks.

Load the sample data →

BRING YOUR OWN DATA

Step 2b

Six CSVs: event, gates, tickets, arrivals, hotels, resources. Nothing leaves your browser.

↓ event.csv

↓ gates.csv

↓ tickets.csv

↓ arrivals.csv

↓ hotels.csv

↓ resources.csv

Choose 6 CSV files →

The /setup screen: Quick Start, the bundled sample fixture, bring-your-own CSVs, and the venue-owner flow — all in one place.

SLICE 1 — TIMELINE

2. Live Ops — default view

Live Ops, the judge-facing default screen: the Timeline row ("days to match" + T-90..Match night stepper), the Calm/Watch/Act status band, the live map, and the single "Do next" action card.

3. Timeline expanded

Slice 1 (Timeline): "When does it become a problem?" — dangerous minutes at each T-90..T-1 snapshot, a plain-language sentence, and the next "do by" playbook actions with real simulated benefit where applicable.

4. Timeline at T-90

90 days before the match: cohort sizes rebuilt from tickets.csv's own T-90 snapshot — a visibly smaller, calmer crowd, and the demo-date pill showing this is not "today."

5. Weather, real data at every horizon

Slice 2 (Weather): a live Open-Meteo reading — forecast or climatology depending on horizon — shown as a chip in the Timeline row, tagged with its real source.

6. Action approved — status stays honest

The recommended action approved live: the status band reads "Calm — in force since HH:MM," never claiming Calm while danger remains unless an in-force action explains it.

7. Predicted vs Actual — before any actuals

Slice 3 card, empty state: a prediction was frozen the moment the plan was approved; waiting for a demo feed or a real gate-scan upload.

8. Predicted vs Actual — demo feed loaded

A seeded demo scan feed (late-train + slow-lane disruptions injected, always tagged "demo feed"): the worst gate's plain sentence and a predicted-vs-actual overlay chart.

9. Predicted vs Actual — recalibrated

The learning loop: a deterministic per-gate turnout/timing fit from the actuals, re-simulated — forecast error shown shrinking, not just asserted.

10. Predicted vs Actual — per-gate trust

Every gate's predicted/actual totals and trust badge ("verified by event" within 15% error, else "claimed") — the same ladder Slice 4 uses for safety documents.

11. Everything else, one tap away

The "More" menu: Ravi's trace vs. the ghost, staff reports, what-if testing, Red Team stress-testing, build-your-own-plan, the Black Box ledger, and links to the owner/registration flows — all reachable from Live Ops without leaving the judge-facing screen.

12. Live Ops footer — buckets + ticker

The six-bucket coverage row (Crowd, Transport, Hotels, Weather, VIP, Money) and the running ticker of what just changed — always-on peripheral awareness for an operator.

13. After-event report

Print / save PDF

← Back to Live Ops

After-event report

Mumbai Indians vs Royal Challengers Bengaluru (Illustrative fixture)

WHAT THE PLAN CHANGED (VS. DOING NOTHING)

Same evening, same people

Dangerous minutes

0 → 0

Outside at showtime

5,140 → 991

Cost

₹0

Plan

Zero rupees: Tell nerul rail that Gate 2 is quieter; Bring palm Beach cabs in 30 minutes earlier; Tell palm Beach cabs that Gate 2 is quieter

PROMISED VS. HAPPENED, PER GATE

DEMO FEED

Gate	Predicted	Actual	Difference	Peak shift	Trust
Gate 2	10,849	8,260	-23.9%	—	CLAIMED
Gate 3	14,072	13,398	-4.8%	+20 min	VERIFIED BY EVENT
Gate 4	3,233	3,139	-2.9%	—	VERIFIED BY EVENT
Gate 1	9,504	9,242	-2.8%	-20 min	VERIFIED BY EVENT
Gate 5	6,045	6,177	+2.2%	-10 min	VERIFIED BY EVENT

After recalibrating from these actuals: forecast error 7.3% → 1.7%.

WHAT WE WOULD CHANGE NEXT TIME

- Gate 2 ran 23.9% quieter than predicted — next time, weight this gate's model toward lower turnout.

Pravaah checks that predicted and actual gate arrivals match. These actuals are a demo feed, not real scan data. It does not certify safety.

Slice 3's printable report: what the plan changed vs. doing nothing, promised vs. happened per gate with trust badges, the recalibration error-shrink line, and a generated "what we'd change next time" list.

14. Your venue (owner screen)

PRAVAAH — VENUE OWNER

Registrations → Safety documents → Live Ops →

Your venue

Gates, parking and entrances — every number here feeds tonight's simulation directly.

Changing gate lanes changes tonight's risk.

Nothing here leaves your browser until you choose to send an order later on.

The venue-owner screen: capacity, exits, gates (lanes/forecourt), parking and entrances — every number here feeds the simulation directly and carries its own trust badge.

15. Safety-document check — before

The screenshot shows a dark-themed web interface for a venue owner. At the top, the header includes the Pravaah logo and the text 'PRAVAAH — VENUE OWNER' on the left, and navigation links '← Your venue' and 'Live Ops →' on the right. The main heading is 'Safety-document check', followed by a subtext: 'Upload or paste a safety/fire-NOC excerpt — Pravaah checks it against the 4 numbers on your venue screen.' Below this is a form titled 'YOUR DOCUMENT' containing a large text area with the placeholder 'Paste a safety/fire-NOC excerpt here...'. At the bottom of the form are three buttons: 'Check this text' (highlighted in orange), 'Upload .txt or .pdf', and 'Use the sample document →'. A small disclaimer at the bottom of the page states: 'Pravaah checks that your numbers match your papers. It does not certify safety.'

Slice 4: /owner/documents, ready for a pasted excerpt, an uploaded .txt/.pdf, or the bundled sample document.

16. Safety-document check — checked

Pravaah checks that your numbers match your papers. It does not certify safety.

The sample fire-NOC excerpt checked against the venue screen: capacity matches, gate lanes and parking mismatch (with the exact quoted snippet one tap away), exits stay "claimed" (never mentioned in the document).

17. Safety-document check — after accepting

Accepting the document's figure updates the venue screen, tags it "document-checked," and re-runs the evening — Live Ops now reflects it.
