

Pravaah — verified after the fix-and-wire pass

This supersedes the earlier review. Since then: two real bugs were fixed (a wrong "40 minutes early" headline claim, and a vote-counting mismatch in The Room), The Room and the Black Box moved from an in-memory Map to a real Supabase project (verified live, including direct database queries), a one-way Telegram ops channel was added and sent a real message to a real chat, the Prove step was restructured from one long scroll into four tabs, the Decision Clock became an actual full-width hero (measured 64px numerals vs. 44px for anything else on the page), and the mobile console notice became a QR code instead of a dead end. Since that pass, a further one turned the static "plan, then approve once" console into a continuous live control room at `/live` (section 09) — a monitor loop, Red-Team-armed tripwires, and dynamic Telegram alerts. All automated tests pass (76 as of section 09); every screenshot below is unedited, taken against the real running app with real credentials, in this order.

What we want from you

Same judging context as before: HackCelestial 3.0, PS-8, ~320 teams / ~120 on this problem statement. Read the screenshots below in order, then answer:

1. **Does the UI now read as finished and premium?** Compare specifically against what you'd expect from the old single-scroll Prove step and the old small Decision Clock pill, if you reviewed those before — are the fixes proportionate to what was wrong, or is there still a gap?
2. **Is anything still inconsistent, unclear, or unfinished-looking?** Name it specifically, with the screenshot filename.
3. **Rank the next five highest-leverage changes** for a judge's first impression, same impact × effort framing as before.
4. **Two specific things we flagged but didn't fix — give us a verdict.** First: the Guide step (Step 5) still shows roughly 24 numbers on screen at once by our own count (see the "console-guide-orders" screenshot) — should it get the same tab treatment Prove just got, and if so what's the natural split? Second: we deliberately stopped short of building the Telegram "Acknowledge" button + webhook loop because it can't be tested without a public deployment — does a one-way send-only ops channel read as a complete feature on its own, or does its absence hurt more than we think?
5. **One thing to cut**, if forced to trade a feature for more polish time.

01 Cover page — first five seconds

This is what a judge sees before clicking anything. The right-hand panel is not a static illustration — it's the actual engine running live in the browser, showing the real do-nothing evening at DY Patil Stadium, with a live-measured `simulate()` timing badge. The headline no longer states a specific lead time (Phase 1 of this pass removed the "forty minutes early" claim, which the Decision Clock itself contradicted on most runs).

Cover page — hero. The right panel is the live engine (do-nothing evening at DY Patil), not a static illustration, with a measured simulate() time. The old "forty minutes early" claim in the headline is gone (Phase 1) — the pitch no longer asserts a number the Decision Clock itself might contradict.

Cover page — the five-step pitch and "what no one else has" (Decision Clock, The Room, Red Team, hotels as control valves).

Cover page — closing CTA and footer.

02 The console — Rehearse, Predict, Explain

Left rail: five numbered steps. Center: a live MapLibre map with a custom canvas overlay. Below the top nav: the Decision Clock, redesigned in Phase 5 into its own full-width band — previously a small pill sharing the header bar with the logo and nav links.

Console — Step 1 Rehearse, intro state before the story plays. Facts (beds/transport/gates) are computed from the scenario, not hand-written.

Console — the rehearsal playing: map animates the calm early evening, captions narrate what is happening.

Console — LIVE mode begins. Decision Clock is testing 12 rough nights in the background; map is calm.

Console — the Decision Clock, redesigned in Phase 5 into its own full-width band directly below the nav (was a small centered pill sharing the 64px header bar with the logo and links). The countdown numerals now measure 64px tall live — the single largest element anywhere on the page (next-largest number on screen: 44px).

Console — Step 3 Explain. Each cause is removed and the evening re-run; two causes each explain ~100% of dangerous minutes → "mismatch, not shortage." The pulse-burst figure now reads "about 2,000 people every 6 minutes" — Phase 1 fixed a real inconsistency where this same screen used to say "about 900," disagreeing with the ~2,000 the Rehearse step (previous screen) already showed for the same fact.

Console — the causal chain read straight out of simulation frames (train pulses → gate mismatch → forecourt fills → crush).

[illegible][illegible][illegible][illegible]

19

Console — "build your own plan," moved in Phase 4 out of the main Prove flow entirely into this drawer, reachable only via the small "Advanced" link on the Plan tab. It no longer appears anywhere in the default demo path.

Console — Red Team drawer: 192 rough nights, tiered outcomes (safe/better/same/worse), heatmap grid, worst night + backup plan.

Console — decision window detail: per-lever benefit curves across 12 rough nights, with the most cautious deadline highlighted.

04

Step 5 · Guide — orders, now with a real Telegram send

Crowd messages stay on their own card (MR/HI/EN, Play on PA, Copy, SMS) — untouched by Phase 3. Staff/transport/accommodation/food order cards gained a "Send to Telegram" button, shown here after a real send to a live ops chat, confirmed inline with a timestamp.

Console — Step 5 Guide, after approval. Map replays with the plan in force; readouts compare to "if you did nothing." The green approval band and the readouts panel are the two most number-dense parts of the app (flagged, not redesigned, in Phase 4 — see the written report).

Console — orders ready to send: crowd message in Marathi/Hindi/English with a PA play button, and staff/transport/accommodation orders with Copy / Send SMS / new "Send to Telegram" (Phase 3) — shown here after a real send, confirmed with "Sent to ops · HH:MM." The crowd-message card deliberately has no Telegram button.

05

Black Box, disclosure, what-ifs, and the mobile view

The Black Box ledger is now Supabase-backed (Phase 2) instead of an in-memory array — same hash-chain math, byte-for-byte, only the storage changed. The mobile console notice was redesigned in Phase 6 from a near-blank dead end into something actually useful.

Console — Black Box ledger, now persisted to Supabase (Phase 2) instead of an in-memory array: every forecast/warning/plan/approval hash-chained, in order. Same hash-chain math as before this pass, byte-for-byte — only where it is stored changed.

Console — Black Box tamper test: a changed entry is caught by the hash chain, proven live in the browser.

"How this works" panel — the honesty/assumptions disclosure (\$13 requirement), what is guessed vs simulated.

Console — what-if chip (heavy rain) re-runs the evening with a scenario patch; do-nothing vs with-plan both shown.

The console is built for a big screen.

It's the organiser's control room: a live map, a five-step rehearsal, the Decision Clock, Red Team, the Black Box. Scan this on a laptop to open it there, or send the link to whoever's running the console.

`http://localhost:3000/console`

[Back to the start](#)

Console on a phone, redesigned in Phase 6. Previously a near-blank "built for a big screen" dead end; now a QR code for the console's own URL (scan to open on a laptop, or forward the link), the URL itself, and a one-line preview of what's there. The console still never attempts to render at phone width — that redirect is correct, it was only ever the empty screen it led to that needed fixing.

06 4 June 2025 replay — the sensitive one

A reconstruction of the real Bengaluru stadium crush from public reporting, run through the same engine. Unchanged by this pass.

Replay page — 4 June 2025 Bengaluru reconstruction. Mandatory disclosure banner, warning/dangerous/ensemble stat tiles, live map.

Replay page — "what the engine says would have mattered most": upstream what-ifs (pass-only entry, gates on time), not gate-lane plans.

Replay page — assumptions and numbered sources, every timeline claim traceable.

07 Any venue — the generalization proof

Four cached venues plus live OpenStreetMap import; switching venues re-simulates and re-optimizes immediately. Unchanged by this pass.

Venues page — "any venue in 60 seconds." Cached venues list, live map, plans panel — default selection.

Venues page — switched to Narendra Modi Stadium (auto-built graph, 132,000 capacity), re-simulated instantly with its own plans.

Venues page — M. Chinnaswamy Stadium (Bengaluru), showing editable estimated levers (gate lanes, crowd size).

08

The Room — now genuinely backed by Supabase

Captured end-to-end with two real headless-browser "phones" (English + Marathi) plus simulated phones, against the running dev server with real Supabase credentials — not the in-memory fallback. Phase 1 also fixed a real vote-counting bug here (the live tally bar and the result footnote could previously disagree); Phase 2 moved all of this off the single dev-server process onto Supabase, with genuine Realtime WebSocket subscriptions confirmed live and the underlying rows confirmed by querying the database directly.

WHAT HAPPENED TO PEOPLE LIKE YOU

You walked to Gate 5. You got in at 19:49, 7 minutes sooner than if nobody had acted. The tightest crowd you stood in: 0.7 people per m² instead of 5.8.

The room said yes 100%. The model predicted 26%. 72 → 0 dangerous minutes.

मराठी हिंदी English

Phone — personal outcome: "what happened to people like you," numbers traced through the re-run.

09

Live Ops — from "static plan, one approval" to a calm, continuous control room

card at a time (Do it / Not now / Why? — the words "Plan" and "Approve" are gone from this path), six honestly-tagged status dots (Simulated vs. Playbook coverage — VIP and Money & refunds are truthfully playbook, not faked), and a single "More" menu holding everything else. Staff report real ground conditions (rain, a rail delay, gates running late — chips or typed text, parsed the same clamped way a what-if question is); Pravaah locks the past, re-runs the rest of the evening, and re-ranks. Red Team's own worst-night backups become pre-armed tripwires — never auto-executed, only proposed. Six dynamic Telegram message types (new move, expiring, status changed, tripwire fired, stopped working, decision recorded) reach the real ops channel, each built from a structured payload, never a number an LLM invented, verified against a real bot and chat.

Live Ops — the new default control room. One status word, one sentence, the map centred and dominant, ONE action card at a time on the right, six status dots at the bottom, a "what changed" ticker. Replaces the old three-column layout that showed up to four action cards and a permanent orders panel.

Clicking a status dot opens its detail: current status, an honest "Simulated" or "Playbook" coverage tag, and the real numbers behind it. Every one of the six buckets (Crowd & gates, Getting there, Hotels, Weather & delays, VIP, Money & refunds) is tagged this way — VIP and Money & refunds are honestly "playbook," not faked as simulated.

The single "More" menu — every other feature (Ravi & the ghost, what-ifs, Red Team, decision windows, build-your-own plan, orders sent, the Black Box, assumptions, venues, replay, full console) is one click away, nothing deleted, none of it cluttering the calm main screen.

Reporting from the ground: six instant chips (rain, rail delay, gates late, more/fewer people, slow lanes) plus a typed field parsed the same clamped way a what-if question is. This is the monitor loop's input — real staff observations, never a number an LLM invented.

Red Team — 192 rough nights tried against the current plan, reached from Live Ops's More menu. Its worst-night backup plan is what a fired tripwire proposes below.

A tripwire fires: staff reported rain, Red Team had already found this breaks the plan most of the time, so Pravaah proposes the exact backup it already computed for the worst night — shown as the one action card, never auto-approved. Status flips to Act now and the ticker at the bottom logs it.

The tripwire's proposed backup, approved — "Done · sent to ops" with a real timestamp confirms the order actually reached the live Telegram channel, and the evening is back to Calm, "in force" from the real current clock time.

The Black Box ledger reading back the whole sequence above — staff report, tripwire fired, re-ranked, approved, orders sent, decision recorded — each entry naming the real Telegram message it sent to the ops channel, hash-chained so nothing here can be quietly edited.

10 Your review

Answer the five numbered questions above using only what you saw here. Reference screenshot filenames where useful (e.g. `09-console-prove-plan-tab.png`).

Captured with Playwright/Chromium against a local Next.js dev server running with real Supabase and Telegram credentials.
